1. Release 3.11.1

This section briefly lists changes to AIOps ALite for this release.

1.1 RELEASE HIGHLIGHTS

None with this release.

1.2 BUGS

- **Connection session from sub execution is not maintained.** The issue of connection sessions not being maintained during the execution of automation processes was identified. Initially, connections closed unexpectedly after executing a sub-automation, leading to reconnections in the main automation. The change involves ensuring that the same connection is reused if the sub-automation executes on the same executioner. The change targets the automation execution processes and is not directly visible in the standard user interface. The purpose of this change was to fix a regression issue caused by the AIOps 3.11.0 upgrade, impacting the automation workflows. Specifically, it aimed to rectify the connection closure after the transition between sub-automation and main automation to improve reliability and maintain consistent execution sessions. This change primarily affects the backend operations by ensuring stable connection sessions in automation processes. While it indirectly benefits end-users by improving automation reliability, it is mainly a backend-level fix affecting developers and system integrators using the AIOps platform for automation tasks. (AM5-30989)
