1. Release 3.5.1

This section briefly lists changes to AI Ops for this release.

1.1 RELEASE HIGHLIGHTS

1.1.1 Rollback to a Previous Version

The database schema is compatible with version 3.5.0. If you need to roll back, AIOps can be downgraded to version 3.5.0 without the need to restore from a full backup.

1.2 BUGS

- [AP-29873] - The permissions issue causing a 403 Forbidden error on task history pages with specific options has been resolved, enabling users to access all task histories in the Support Amelia UI without encountering errors.
- [AP-29967] - The connect timeout setting for ProxySQL was increased to prevent connectivity issues with Percona pods during performance tests and avoid taking hostgroups offline due to reaching max timeout limits; this is a backend change aimed at improving database stability and availability during high-load scenarios.
- [AP-29994] - The import process for Knowledge Articles now includes only active and published articles, improving content quality by excluding unapproved items; this is a backend change that indirectly enhances the user experience by ensuring only verified content is available.
- [AP-29998] - This ticket resolved an issue where audio was not audible during phone call automations in the Alite and Platform environments, impacting the automation testing interface to ensure consistent voice feedback during test scenarios.
- [AP-30019] - The runbook instructions for automating firewall rule configurations were updated to resolve compatibility issues caused by a change in the GPT model, specifically affecting backend automation scripts related to network management.
- [AP-30033] - Unsupported OAuth Grant Types (Client credentials & Password) were removed from the Gmail integration UI to ensure only supported options are displayed, improving user experience and preventing configuration errors.
- [AP-30051] - The 'Global' option was added to the client dropdown in the Event Correlation section to enhance flexibility and completeness in the user interface.
- [AP-30055] - Events are now deduplicated efficiently without generating unnecessary tasks, and event data is sanitized by removing unsupported characters, ensuring compliance with alphanumeric characters, hyphens, dots, and trimming extra whitespaces; there are no changes to the UI since the modification mainly impacts backend processes, optimizing system efficiency and maintaining data integrity without affecting customer-facing interfaces.

1.3 EPIC

None in this release.

1.4 STORY

None in this release.

1.5 TASK

- [AP-30032] - The commons-io library was upgraded from version 2.11.0 to 2.17.0 to address the security vulnerability CVE-2024-47554, impacting the backend security framework without affecting the GUI.

1.6 SUB-TASKS

None in this release.
